Dear John:

The relation between crocidolite and mesothelioma seems to be pretty strongly established by experience in South Africa and elsewhere. The relation between chrysotile and mesothelioma is not clear. If it exists, it apparently is much less prounced than that shown by crocidolite.

The limit of 5 MPPCF that we observe in our operations is still recognized in the United States as satisfactory for chrysotile, but there is strong feeling that it is much too high for crocidolite. I wouldn't be at all surprised to see supplied-air respirators recommended for handling the latter.

In our own operations with chrysotile, I feel that we should try to control the dust to levels as far below 5 MPPCF as reasonably possible. That is, I don't believe we should be content with control that just maintains the level at 5 MPPCF. Actually, this figure is known as a threshold guide and not a level that strictly defines safe and unsafe conditions.

There is some thought that metals associated with asbestos either from the ore or from milling machines, etc., may be part of the problem. Investigation is underway to evaluate this potential; and as soon as I hear more about it, I'll let you know.

Very truly yours, DISTRIBUTION J. A. Riddle Paul W. McDaniel R. O. Marsten ' Industrial Hygiene Engineer W. E. Hicksapple PWM:dmf A. A. Andrade [G. C. Brice Shifters RECEIVED J. L. Myers A11918 JAN 22 1968 K. A. Wood D₁ S. Kamens U.C.C. CHEM. & PLASTICS C. ¿essels K. West File

Dear Paul:

Enclosed is a copy of an article from the San Francisco Chronicle re mesothelioma and asbestos. I would be interested in your reaction. Is 5 MMPCF still considered good enough, or should we go to remote-controlled equipment and eir-line masks like the nuclear industry uses? I've seen one article which implies that crocidolite may be the harmful variety rather than chrysotile. Have you anything on comparative toxicology of various species of asbestos?

Very truly yours,

J. A. Riddle
